

pySimpleView calibration target

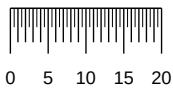

PRINT AT 100% / ACTUAL SIZE (turn off scaling / 'fit to page').

Verify the 100 mm bar with a real ruler before trusting it.

1 mm grid | heavy lines every 5 mm | labels every 10 mm (mm)

0.5 mm divisions over 20 mm (near print limit; for higher mag):

How to calibrate in pySimpleView:

1. Lay this sheet under the microscope; focus on the 1 mm grid.
2. Calibrate... then drag a line across as MANY whole mm as you can see (e.g. label 0 to 10). A longer span = a more accurate result.
3. Enter that length in μm (10 mm = 10000 μm). Then use Measure.
